A dihybrid cross is a cross between two normal organisms from different species to study the inheritance of two pairs of alleles. In the example pictured to the right, RRYy/rryy parents result in F1 offspring that are heterozygous for both R and Y (RrYy). In a dihybrid cross, two characteristics are crossed together to get final results.

"Dihybrid cross is the cross between two different genes that differ in two observed traits.". Recall that in a dihybrid cross, you expect a 9:3:3:1 ratio of phenotypes -- if you don't recall this, you can review it in the module called "Counting Mice with Fangs". \* Each characteristic is determined by a single gene.
